

TEST

To better assess your skills, we'd like you to complete a test that focuses on React, Tailwind CSS, and Vite.js, with an emphasis on creating a visually appealing and functional user interface.

Objective:

You will build a simple interactive quiz app where users can answer questions about a topic of your choice. The app should be visually engaging and responsive, with a smooth and user-friendly design. We expect the test to be completed within **2 hours**.

Test Details:

Task Overview:

- Build an interactive quiz app where users can select answers to multiple-choice questions.
- At the end of the quiz, the user should be able to see their score.
- Use **React** for building components, **Tailwind CSS** for styling, and **Vite.js** for the build process.

Requirements:

1. Quiz Functionality:

- Present at least **5 questions** with **multiple-choice answers**.
- Each question should have **4 answer options**, with only one being correct.
- When the user selects an answer, provide feedback (e.g., "Correct!" or "Wrong answer").
- At the end of the quiz, display the user's score out of 5.

2. Design & UI:

- The quiz should be visually engaging, with a modern, clean design.
- Use **Tailwind CSS** to create a responsive, accessible interface.
- Focus on good use of whitespace, typography, color contrasts, and hover effects.
- Each question should be presented in a card-style layout with clearly styled buttons for the answer choices.
- Include smooth transitions between questions, using animations or subtle effects (e.g., fade-ins or slide-ins).

3. Responsiveness:

- Ensure the app is fully responsive and works well on both mobile and desktop devices.

- Tailwind CSS's responsive utilities should be used to handle different screen sizes.

4. **Bonus (Optional):**

- Add a **progress bar** at the top to show how far the user is into the quiz.
- Animate the transition between questions to enhance user experience.
- Provide a **summary page** at the end of the quiz, showing the user's answers, correct answers, and score breakdown.

Tools & Technologies:

- **React:** Build the app using functional components and hooks (useState, useEffect, etc.).
- **Tailwind CSS:** Use Tailwind for styling. The design and visual appeal are important, so we'll be paying close attention to the UI.
- **Vite.js:** Use Vite as the build tool for your project.

Design Focus:

The design and style of the app are just as important as its functionality. We'll be looking for:

- A clean and modern UI.
- Effective use of **Tailwind CSS** to create a visually appealing and responsive layout.
- Attention to detail in typography, spacing, and overall user experience.

Submission Guidelines:

1. **GitHub Repository:**

- Create a new GitHub repository for this project.
- Commit your code with meaningful commit messages throughout the development process.
- Share the repository link with us once you've completed the task.

2. **Folder Structure:**

- Ensure your project folder is well-organized and includes all the necessary files (React components, CSS files, etc.).
- Include a README file with instructions on how to run the app.

3. **Timeline:**

- You have a total of **2 hours** to complete the task.
- Please ensure that you submit the GitHub repo within this time

frame.

Evaluation Criteria:

We will assess your submission based on the following:

1. **Functionality:** Does the quiz app work as expected? Are all the features implemented correctly?
 2. **Code Quality:** Is the code well-organized, clean, and easy to understand? Have you made good use of React components and hooks?
 3. **Design & UI:** Is the app visually appealing? Does it have a professional and modern design? Are the design elements consistent and responsive?
 4. **Responsiveness:** Does the app look good and function well on different screen sizes (desktop, tablet, mobile)?
 5. **Bonus Features** (if implemented): Did you add any extra features, such as a progress bar or animated transitions?
-

Getting Started:

1. Set up your project:

- Use **Vite** to initialize your React app by running the following command:

```
npm create vite@latest my-quiz-app -- --template react
```

- Install **Tailwind CSS** by following [this guide](#).

2. API for Quiz Questions (Optional):

- You can either hard-code the questions into the app or fetch them from an API like Open Trivia Database.

3. Running the App:

- Once you've set up your project, you can run the development server with:

```
npm run dev
```
